# **Boundary Detection**

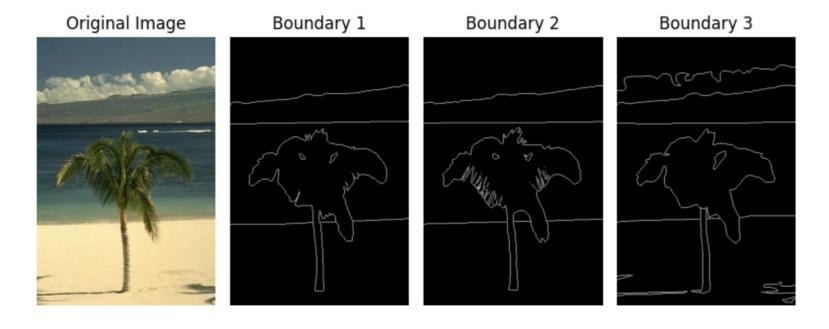

Group 5: Qin Tong Bettina Tee, Daso Jung, Yan Renyu

### Contents

- 1. Problem Statement
- 2. Approach taken to solve the problem
- 3. Key findings and observations
- 4. Live demo
- 5. Challenges encountered and how they were addressed

### **Problem Statement**

Predict boundary score maps for given image, where each pixel's value (between 0.0 and 1.0) indicates the likelihood of being part of an object boundary.

### Approach taken to solve the problem

- 1. Feature + Target Extraction
- 2. Feature Importance
- 3. Parameter Prediction
- 4. Image Processing
- 5. Edge Detection

### 1. Feature + Target Extraction

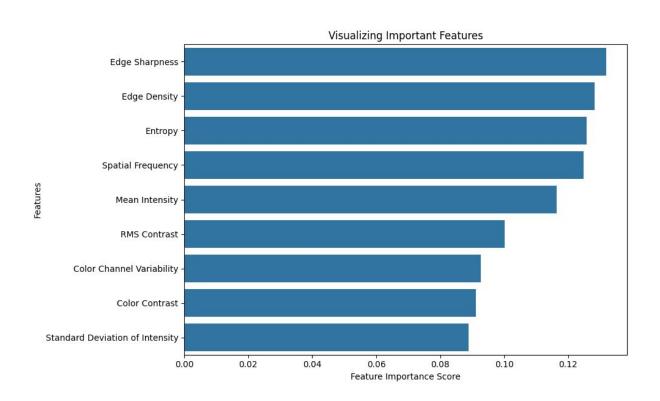

### **Features extracted:**

- 1. Edge Density
- 2. Edge Sharpness
- 3. Colour Contrast:
- 4. Root Mean Square Contrast
- 5. Entropy
- 6. Mean Intensity
- 7. Standard Deviation of Intensity
- 8. Colour Channel Variability
- 9. Spatial Frequency

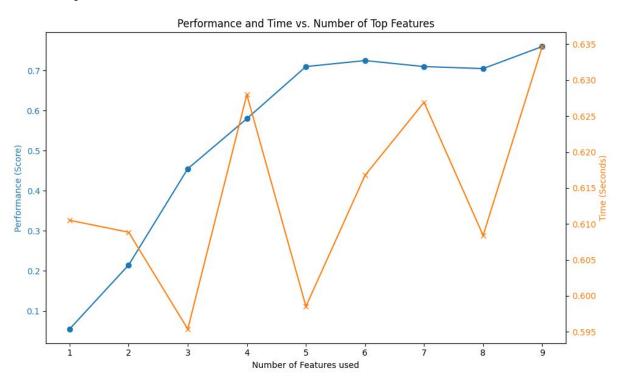

### **Target (parameters for preprocessing):**

- Gaussian Blurring:
  - a. blur amount
  - b. sigma
- 2. Contrast Enhancing:
  - a. contrast factor

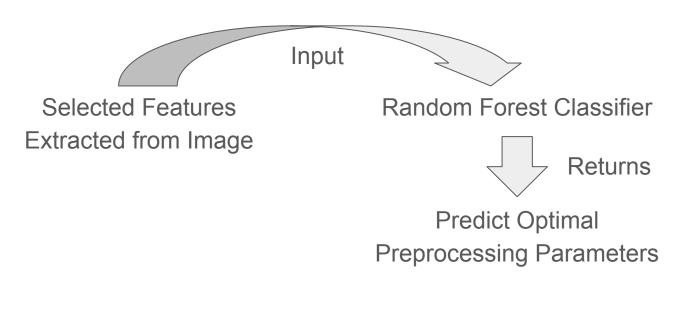

# 2. Feature Importance

# 2. Feature Importance

### 3. Parameter Prediction

Hyperparameter Tuning (GridSearch)

Best Random Forest Classifier

## 4. Image Preprocessing

Original Image

\_\_\_

Gaussian Blurring

Optimized Parameter

- 1. Sigma
- 2. Blur amount

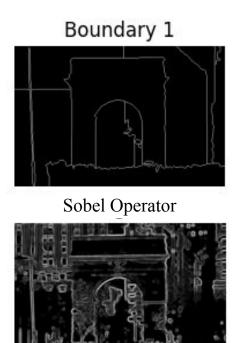

Contrast Enhancing

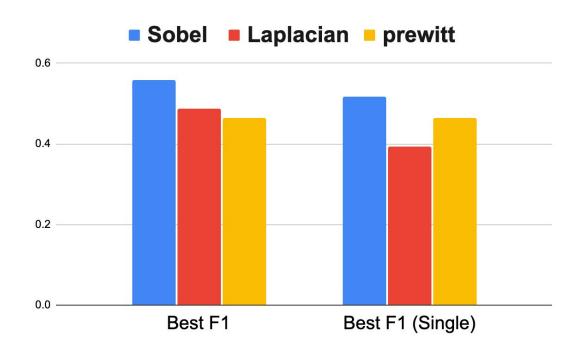

Optimized Parameter

1. Contrast Factor

# 5. Edge Detection

Key Findings and Observations

### Key metrics

- F1-score: Harmonic mean of precision and recall
- Best F1: Average F1-score using optimal threshold for each image
- Best F1 (Single): Average F1-score using a single optimal threshold for all images
- Recall: proportion of actual edges correctly identified
- Precision: Proportion of correctly predicted edges among all classified edges

# Impact of Preprocessing

	Average F1-score	Best F1	Best F1 (Single)
Without preprocessing	0.54	0.56	0.52
With preprocessing	0.64	0.65	0.63

### Improvement:

- 18.5% increase in average F1-score (from 0.54 to 0.64)
- Significant impact in Sobel operator performance.

### **Training Set Results**

- Metrics:
  - Average F1-score: 0.57
  - Best F1: 0.59, Best F1 (Single): 0.56
  - Recall: 0.67, Precision: 0.52
- Range Across Images:
  - Recall: 0.4 to 0.95
  - Precision: 0.2 to 0.9
- Insights
  - Optimized thresholds marginally improve F1-scores
  - High recall indicates most edges were detected
  - Lower precision suggests more false positives

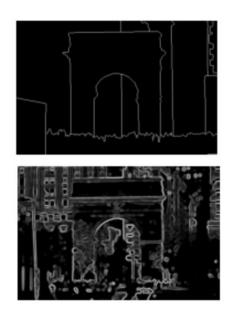

### Test Set Results

- Metrics:
  - Average F1-score: 0.54
  - Best F1: 0.55, Best F1 (Single): 0.52
- Insights
  - Image-specific thresholds improve results
  - Slight performance drop from training to test set
  - o Training F1-score: 0.57, Test F1-score: 0.54
  - Gap of 0.03 suggests minor overfitting

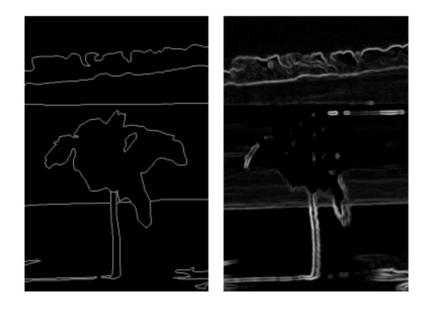

# Live Demo

# Challenges

1. Different images characteristics

Too much detail

Overly simplified

## Challenges

2. Very wide grid search space, a long time to run grid search → Bayesian Optimisation (less time + computation intensive)

```
# search space of paramters of blur_amounts, sigmas, contrast_factors
search_space = [
    Categorical([3, 5, 7, 9]), # blur_amount for red
    Categorical([3, 5, 7, 9]), # blur_amount for green
    Categorical([1, 0, 3, 0, 5, 0, 7, 0, 9, 0]), # sigma for red
    Categorical([1, 0, 3, 0, 5, 0, 7, 0, 9, 0]), # sigma for green
    Categorical([1, 0, 3, 0, 5, 0, 7, 0, 9, 0]), # sigma for blue
    Categorical([1, 0, 1, 5, 2, 0, 3, 0, 4, 0, 5, 0, 6, 0, 7, 0]), # contrast_factor for
    Categorical([1, 0, 1, 5, 2, 0, 3, 0, 4, 0, 5, 0, 6, 0, 7, 0]), # contrast_factor for
